

How does oralcell work?

When asked this question, researcher Dr. Bear Walker who has utilized oralcell in testing with the BioTracker® explains that in his view oralcell increases the effectiveness of every cell of the body by helping the cell utilize the energy that is available to it. It increases the potential of every cell of the body. It enhances ATP (adenosine-triphosphate) production and enhances the function of the mitochondria.

We know that the full body of enzymatic processes (over 1500 of them) is supported by the ingestion of trace elements. oralcell offers the full scope of these elements which act as a catalyst, benefiting the building of healing mechanisms to support health.

oralcell is a potent detoxifier. As a result of a crystallization process the mineral clay present in oralcell reduced into small particles that make it easy for the body to assimilate. In the report [Calcium Montmorillonite Clay A Miracle of Life](#) Dr. Simon Cohen, N.D. states "Calcium Montmorillonite restores minerals in the tissues where they are needed. Furthermore, minerals are the carriers of the electrical potential in the cells which enable the hormones, vitamins, and enzymes to function properly."

It further states "The negative charges on the clay give it the ability to adsorb or attract positively charged toxic matter, which is then absorbed into the clay and dispelled from the body as waste."

The oralcell Natural Chelated Minerals in clay form will [absorb poisons](#), (detoxify) and can enhance or expand the effects of whatever nutrients have been taken. For instance, if the herbs ginseng and garlic or a vitamin or antioxidant is taken in conjunction with the oralcell Natural Chelated Minerals, one could benefit from greater assimilation because of the clay's action as an intestinal cleanser and gastrointestinal regulator. As the body cleanses or purifies, it is in a better position to more efficiently assimilate nutrients it needs.

It is a common complaint of many vitamin users that their use does not result in the desired effects. We understand that because of a malfunctioning colon, these supplements or nutrients may not be properly absorbed. Whereas a healthy person will digest most of whatever food substance he or she puts into the body, someone whose colon function is deficient may have difficulties in digesting. This affects the well being of the individual, the person can feel run-down, cranky, and sick. Clay can be an important part of one's health program because it assists and supports colon function. As a result we can assume that, whatever supplements are taken in addition to the clay will be better used by the body because the body will have the means to do so.
